

# DIGITAL MODELLING OF PRIMARY CHILD HEALTH

FIRST 1000 DAYS

## **Liesbeth Siderius**

Foundation Rare Care World &  
Foundation Shwachman Diamond  
Syndrome, The Netherlands

## **Sahan Damsiri Perera**

University of Colombo, Sri Lanka

# Digital Modelling of Primary Child Health

---

## Aim

- Identifying **pertinent child health data** points suitable for collection by parents and primary care providers.
- Developing **appropriate terminologies** for coding the collected data to ensure seamless interoperability between primary care and home-based records.
- Constructing an implementation guide adhering to the **FHIR standards** specifically for children during their formative years.

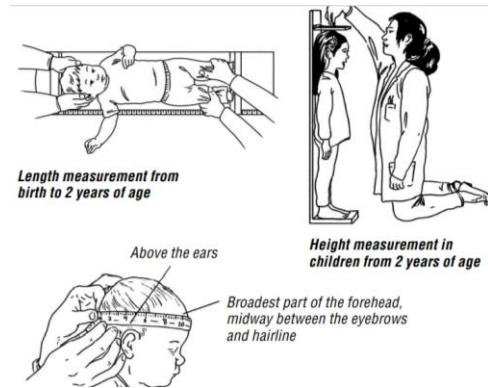

## Method

An analysis of **WHO's Pocket-Book on Primary Health Care for children and adolescents** and recommendations on **home-based records** for maternal, newborn, and child health is conducted to ascertain relevant data points. identify a **set of suitable terminologies** for data coding and explore the **FHIR** framework's standardization.

World Health Organization

# Digital Modelling of Primary Child Health

<https://www.who.int/europe/publications/i/item/9789289057622>

# Digital Modelling of Primary Child Health

---

- The **LOINC** has a specific value in child health data since **numeric data** such as height, weight, head circumference measurements, and development can be followed in **time and place**.
- Six Illustrative cases from **The WHO Pocket Book on Primary health care for Children and Adolescents** (WHO Europe, 2022)
- Proof of concept for a comprehensive implementation guide that harnesses the power of LOINC and **HL7/FHIR standards**,
- Facilitating the seamless integration of **WHO's quality healthcare standards** into diverse primary care environments for children and adolescents.

# Global Child Health

## Cases

1. Fetal Alcohol syndrome
2. Maternal Achondroplasia
3. Breech-Cleft Palate-Microtia
4. Neonatal Jaundice & Hyperbilirubinaemia
5. Juvenile Cataract
6. Beta Thalassemia

WELL-CHILD VISIT: BIRTH – 72 HOURS

## 3.2 Well-child visit: birth – 72 hours

Most children will be seen in hospital for these visits; if not, they ought to be seen by the primary care provider within 24 hours of birth and again at 48–72 hours.

- Look for congenital diseases and jaundice
- Support caregivers.

### History

- Problems during pregnancy, e.g. diabetes, medications, substance abuse, acute or chronic infections, mental or social stress, abnormal test results, e.g. positive group B Streptococcus, HIV, hepatitis B
- Mode of delivery and problems during or after birth
- Congenital disorders in the family, e.g. hip problems
- Hip dysplasia risk factors, e.g. twin pregnancy, breech position
- Problems passing meconium and urine
- Apgar score at 5 and 10 min of life (Table 5).

## Two Month Old Girl at PCH Visit

**Mother :** Substance abuse (alcohol) prior and probably during pregnancy

**Pregnancy & Fetus :** Delay in head growth by ultra sound observations at 28 weeks of pregnancy

**Child at birth :** Microcephaly at birth

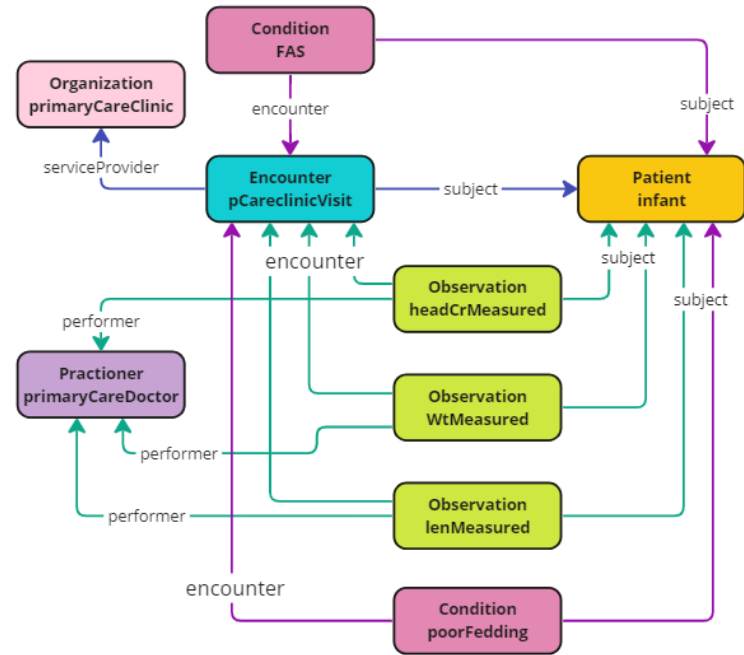

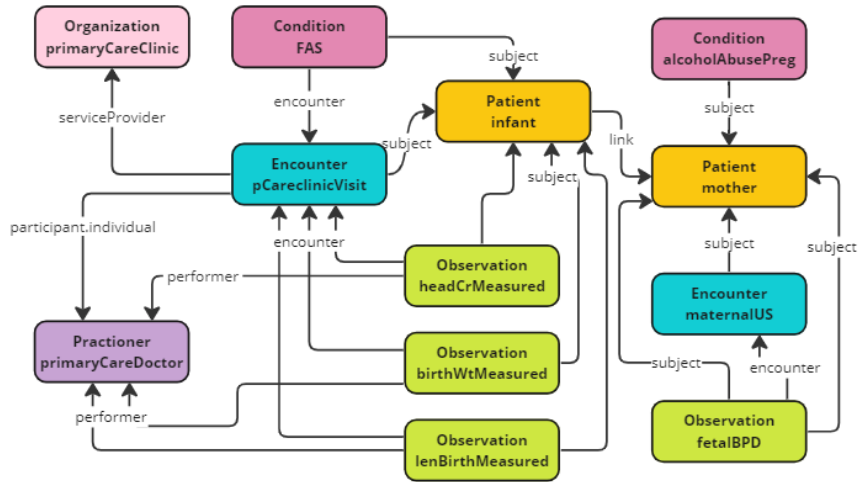

**At 2 months :**

- Postnatal slowing of head growth
- Poor feeding and slow weight gain
- *Recognizable feature* - Small palpebral fissures, smooth philtrum and thin upper lip

**Probable Diagnosis:** Fetal alcohol syndrome

# Case 1 - Fetal Alcohol syndrome

## Terminologies

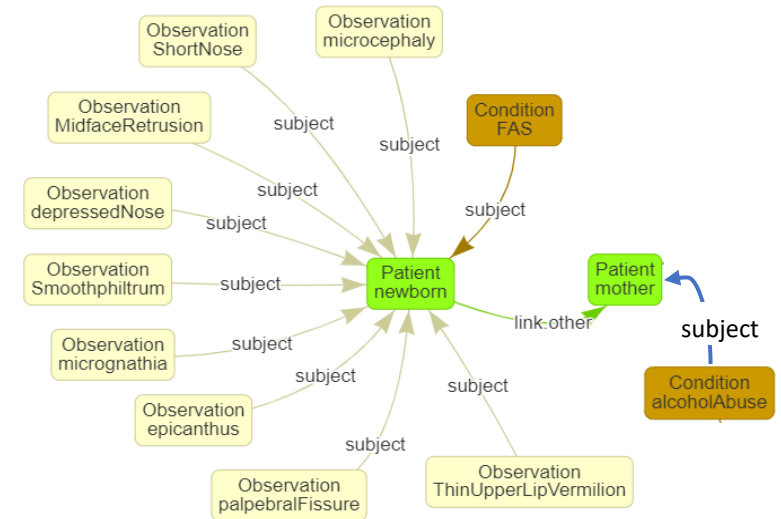

|  |           |         |
|--|-----------|---------|
| Fetal Head Diameter.biparietal US                    | LOINC     | 11820-8 |
| Head Occipital-frontal circumference by Tape measure | LOINC     | 8287-5  |
| Birth weight Measured                                | LOINC     | 8339-4  |
| Body height Measured -at birth                       | LOINC     | 89269-5 |
| Body weight Measured                                 | LOINC     | 3141-9  |
| Body height Measured                                 | LOINC     | 3137-7  |
| Feeding disorder of infancy and childhood            | ICD 10    | F98.2   |
| Alcohol Use Complicating Pregnancy                   | ICD 10-CM | O99.310 |
| Fetal Alcohol Syndrome                               | ICD 10    | Q86.0   |

# Phenotype Recording

|         |                          |                          |            |
|---------|--------------------------|--------------------------|------------|
| Newborn | Microcephaly             | Human Phenotype Ontology | HP:0000252 |
|         | Depressed nasal bridge   |                          | HP:0005280 |
|         | Smooth philtrum          |                          | HP:0000319 |
|         | Micrognathia             |                          | HP:0000347 |
|         | Epicanthus               |                          | HP:0000286 |
|         | Short palpebral fissure  |                          | HP:0012745 |
|         | Midface retrusion        |                          | HP:0011800 |
|         | Short nose               |                          | HP:0003196 |
|         | Thin upper lip vermilion |                          | HP:0000219 |
|         | Fetal Alcohol Syndrome   |                          | ICD10      |
| Mother  | Alcohol abuse            | ICD10                    | F10.10     |

# Fetal Alcohol syndrome

The screenshot shows the Manatū Hauora website page for Fetal Alcohol Spectrum Disorder (FASD). The page is titled "Fetal alcohol spectrum disorder (FASD)" and includes a search bar, navigation menu, and a list of resources. The main content area features a heading "Fetal alcohol spectrum disorder (FASD)" and a sub-heading "Disabilities". Below this, there is a section titled "Fetal alcohol spectrum disorder" with a sub-heading "Low vision". The main text states: "Stop drinking alcohol if you could be pregnant, are pregnant or are trying to get pregnant. There is no known safe level of alcohol consumption during pregnancy." A list of symptoms is provided: "Babies exposed to alcohol before birth may develop fetal alcohol spectrum disorder (FASD). FASD can cause problems including: low birth weight, distinctive facial features, heart defects, behavioural problems, intellectual disability." There is also a "Resources" section with a link to "Alcohol and Pregnancy: What you might not know" and a "Related websites" section.

The screenshot shows the healthdirect website page for Fetal Alcohol Spectrum Disorder (FASD). The page is titled "Fetal alcohol spectrum disorder" and includes a search bar, navigation menu, and a list of resources. The main content area features a heading "Fetal alcohol spectrum disorder" and a sub-heading "5-minute read". Below this, there is a section titled "Fetal alcohol spectrum disorder" with a sub-heading "5-minute read". The main text states: "Fetal alcohol spectrum disorder (FASD) is a group of conditions that can affect a child's physical and mental health. It is caused by drinking alcohol during pregnancy." There is also a "Resources" section with a link to "Alcohol and Pregnancy: What you might not know" and a "Related websites" section.

The screenshot shows the American Academy of Pediatrics website page for Fetal Alcohol Spectrum Disorders. The page is titled "Fetal Alcohol Spectrum Disorders" and includes a search bar, navigation menu, and a list of resources. The main content area features a heading "Fetal Alcohol Spectrum Disorders" and a sub-heading "Patient Care". Below this, there is a section titled "Fetal Alcohol Spectrum Disorders" with a sub-heading "Patient Care". The main text states: "We've assembled resources related to Fetal Alcohol Spectrum Disorders (FASD) to raise awareness of individuals with an FASD, promote screening for prenatal exposure to alcohol and encourage referral for diagnostic evaluations for an FASD. The goal is to build the capacity of pediatricians, nonphysician clinicians, and allied health professionals to ensure that all individuals with an FASD, and their families, receive a diagnosis and care in their medical home for any condition along the FASD continuum." There is also a "Resources" section with a link to "Alcohol and Pregnancy: What you might not know" and a "Related websites" section.

The screenshot shows the NHS website page for Foetal alcohol spectrum disorder. The page is titled "Foetal alcohol spectrum disorder" and includes a search bar, navigation menu, and a list of resources. The main content area features a heading "Foetal alcohol spectrum disorder" and a sub-heading "Foetal alcohol spectrum disorder". Below this, there is a section titled "Foetal alcohol spectrum disorder" with a sub-heading "Foetal alcohol spectrum disorder". The main text states: "If you drink alcohol during pregnancy you risk causing harm to your baby. Sometimes this can result in mental and physical problems in the baby, called foetal alcohol spectrum disorder (FASD). FASD can happen when alcohol in the mother's blood passes to her baby through the placenta." There is also a "Resources" section with a link to "Alcohol and Pregnancy: What you might not know" and a "Related websites" section.

### CARE AND PHYSICAL EXAMINATION OF THE NEWBORN AFTER BIRTH

#### Vitamin K

- 1 mg vitamin K IM within the first hour of birth (during initial breast-feeding while the infant is in skin-to-skin contact with the mother) **or**
- 3 doses of 2 mg vitamin K orally: at birth, at 4 to 6 days, and at 4 to 6 weeks.
- Preterm newborns should receive a lower dose 0.4 mg/kg IM.

#### Vitamin D

- Daily dose of 400 IU vitamin D starting within days after birth for at least the first 12 months of life.

#### History

Take a thorough medical history including:

- **Baby's progress since birth:** any parental concerns, feeding, problems in passing urine (usually within 24 hours of birth) and meconium (usually within 48 hours of birth) (p. 150).
- **Maternal history:** age, social background, chronic maternal diseases, medical treatments and drugs, recreational drugs including alcohol and smoking.
- **Family history:** father's age, genetic conditions, consanguinity of parents, previous pregnancies and health of siblings.
- **Present pregnancy:** medical conditions that may have influenced the pregnancy (e.g. gestational diabetes), complications, screening tests and special diagnostic procedures, exposure to maternal infectious diseases such as hepatitis B (p. 168), HIV (p. 167), cytomegalovirus (p. 163), syphilis (p. 164) or toxoplasmosis (p. 165) during pregnancy or delivery.
- **Labour and delivery:** mode of delivery, length of labour, signs of fetal distress, drugs and/or anaesthesia given, APGAR score (p. 24).
- **Risk factors for neonatal infections:**
  - Premature rupture of membranes (> 18 h before delivery)
  - Maternal fever > 38 °C before delivery or during labour
  - Foul-smelling or purulent (chorioamnionitis) amniotic fluid
  - Maternal colonization with Group B streptococcus
  - Preterm delivery.

5. NEWBORN HEALTH

## Pregnant woman visit PCH at 22 weeks pregnancy

**Mother : Diagnosed with achondroplasia (data academic hospital)**

**Pregnancy & Fetus :** Short femur by ultra sound observations at 22 weeks of pregnancy

PCH officer considers child has achondroplasia & Refer to academic hospital

**Child at birth : Macrocephaly and short stature** at birth

### After birth:

Child head circumference and body length are followed according to achondroplasia growth curves

Achondroplasia curves are available in PCH and home-based record

# Case 2 - Maternal Achondroplasia

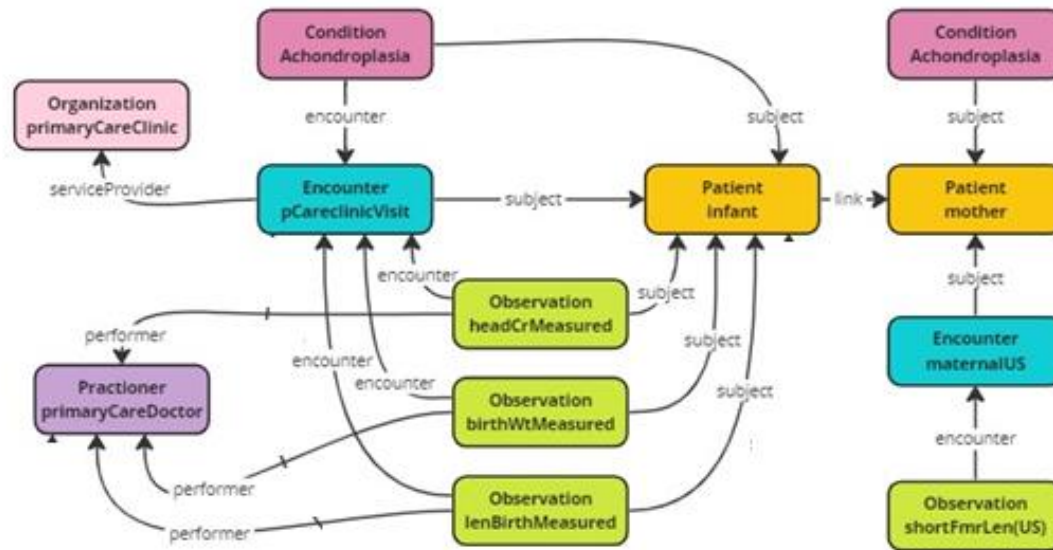

## Date Flow

Maternal Record

Home Based Record

## FHIR

## Terminologies

|  |        |         |

LOINC 8302-2 Body height

LOINC 8287-5 Head Occipital-frontal circumference by Tape measure

Hydrocephalus Risk

New Treatment

**Achondroplasia-growth curve at each primary care visit**

**The company will price the treatment at roughly \$300,000 per year**

## 3.2 Well-child visit: birth – 72 hours

Most children will be seen in hospital for these visits; if not, they ought to be seen by the primary care provider within 24 hours of birth and again at 48–72 hours.

- Look for congenital diseases and jaundice
- Support caregivers.

### History

- Problems during pregnancy, e.g. diabetes, medications, substance abuse, acute or chronic infections, mental or social stress, abnormal test results, e.g. positive group B Streptococcus, HIV, hepatitis B
- Mode of delivery and problems during or after birth
- Congenital disorders in the family, e.g. hip problems
- Hip dysplasia risk factors, e.g. twin pregnancy, breech position
- Problems passing meconium and urine
- Apgar score at 5 and 10 min of life (Table 5).

### Cleft lip and palate

- ▶ Refer for surgical closure. Closure of the lip can be done at 6 months and of the palate at 1 year of age. The lip may be repaired earlier if it is safe to give an anaesthetic and the repair is technically possible.
- ▶ Closely monitor feeding and growth. Babies with isolated cleft lip can feed normally, whereas cleft palate is associated with feeding difficulties.
- ▶ Provide feeding advice to the caregivers: feed with expressed breast milk from a cup and spoon or bottles; a special teat may be used. The technique of feeding is to deliver a bolus of milk over the back of the tongue into the pharynx with a spoon, pipette or some other pouring device. The baby will then swallow normally. Refer if feeding or weight gain is not satisfactory.
- ▶ Note that sleep-related upper airway obstruction can cause hypoxaemia and growth failure. If suspected, refer for specialist treatment.

## Breech Delivery with Congenital Anomalies

Mother : **Breech delivery**

Child at birth : Birth Weight

Physical examination at 5 hours after birth :

- Congenital anomaly visible at birth: **Cleft palate | Microtia**

PCH rerefers to:

- Cleft palate team | Auditory screening (microtia risk of hearing deficit) | Genetic test: Genetic cleft lip palate | Ultrasound hip (risk hip Dysplasia)

PCH Information for Home based record : Feeding difficulty:

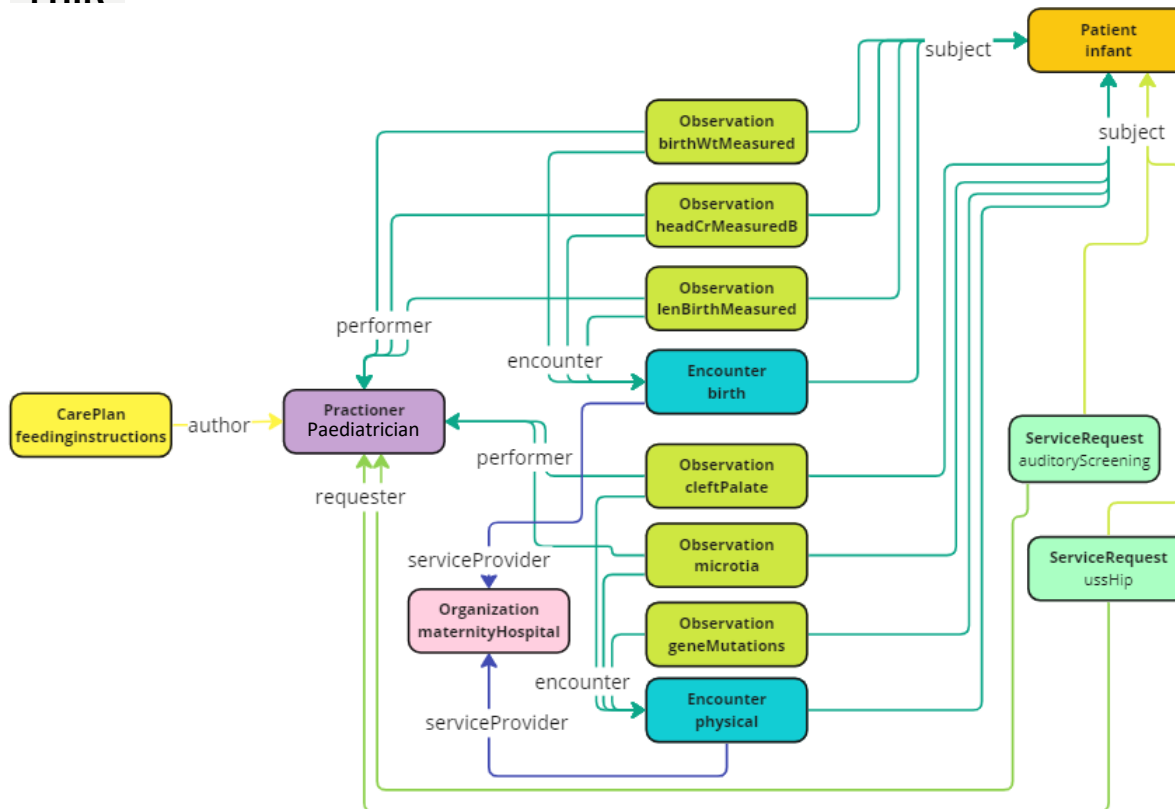

Feed with expressed breast milk from a cup and spoon or bottles; a special teat may be used. The technique of feeding is to deliver a bolus of milk over the back of the tongue into the pharynx with a spoon, pipette or some other pouring device. The baby will then swallow normally.

World Health Organization

# The need for neonatal jaundice screening awareness in the Pakistani population: short communication

- Educating the mothers on screening for early detection of neonatal jaundice and seeking medical treatment in a country like Pakistan, which is considered a high-risk population, is crucial.
- Also, as most females give birth at home, hence, midwives' knowledge about neonatal jaundice also needs to be improved.

Naeem H, Ullah K, Ochani S, Naeem K, Ahmad HB, Hasibuzzaman MA. The need for neonatal jaundice screening awareness in the Pakistani population: short communication. Ann Med Surg (Lond). 2023 Jul 3;85(8):4187-4189. doi: 10.1097/MS9.0000000000000960. PMID: 37554868; PMCID: PMC10406009.

## 3.3 Well-child visit: 1 week

- Look for congenital diseases and jaundice
- Follow up weight gain and vaccinations
- Support caregivers and counsel on feeding, activity and safety

### History

- Care situation and exceptional burdens in the family
- Feeding difficulties
- Abnormal crying
- Congenital disorders in the family, e.g. hip problems, eye conditions

### Examination

- ▶ Perform a complete physical examination (p. 116). Look for signs of acute illness or congenital conditions:
  - **Growth:** measure body weight, length and head circumference (p. 21) and confirm the z-score according to the WHO growth charts (Annex 3). Newborn typically lose up to 10% of their birth weight during the first days of life and regain it within 10–14 days. If weight loss exceeds 10% of birth weight, see p. 119.
  - **Skin:** pallor, cyanosis, jaundice (p. 148), rashes (p. 143), hydration
  - **Head and neck:** bulging fontanelle (p. 128), crepitations, cleft palate (p. 129), caput succedaneum (p. 126), ptosis (p. 134), absent red eye reflex (p. 133), coloboma (p. 133), nystagmus, ear deformities (p. 131)

### Cloudy lens or absent red reflex

A lens opacity (grey-white clouding of the lens) or absence of the red reflex, during the red reflex examination (p. 119), can be a sign of both congenital cataract (p. 459) and early retinoblastoma (p. 459).

- ▶ Refer newborns with an absent red reflex or a cloudy lens immediately to an eye specialist. Early detection and treatment are essential.

# Visual impairment

---

Infantile cataracts remain one of the **most treatable causes of lifelong visual impairment.**

While the chance of improving vision for children with infantile cataracts has never been better,

**Significant global and socioeconomic disparities** still exist in their early management.

Lenhart PD, Lambert SR. Current management of infantile cataracts. *Surv Ophthalmol.* 2022 Sep-Oct;67(5):1476-1505. doi: 10.1016/j.survophthal.2022.03.005. Epub 2022 Mar 17. PMID: 35307324; PMCID: PMC10199332.

# Case 6 - Beta Thalassaemia

## A four Month Old Child at PHC Visit In Sri Lanka

### 7.14 Thalassaemia

Thalassaemias are a group of autosomal-recessive hereditary blood disorders, which are characterized by defective haemoglobin chains. Based on the defective globin chain, they are classified as either  $\alpha$ - or  $\beta$ -thalassaemia. They are more common in Mediterranean countries but immigration has led to wider distribution.

#### History

Assess for risk factors:

- Family history of  $\alpha$ - or  $\beta$ -thalassaemia
- History of recurrent need for transfusions in patient or family member
- Prenatal diagnosis declined by the pregnant woman or couple at risk of thalassaemia carrier status
- Ethnic background from sub-Saharan Africa, Mediterranean and Arabian peninsula, Southeast Asia, Indian subcontinent.

#### Symptoms

Symptoms and timing of clinical manifestation depend on the type of thalassaemia. Severity of symptoms ranges from asymptomatic minor forms or silent carrier status to death in utero in severe forms (alpha-thalassaemia major).

Symptoms include:

- Pallor
- Abdominal distension
- Failure to thrive, poor feeding, decreased activity, lethargy
- Enlarged liver and spleen
- Jaundice
- Symptoms of gallstones: sudden intense pain in upper right abdomen
- Skeletal deformities: large head with frontal and parietal bossing, "chipmunk" facies, misaligned teeth.

#### Investigations

- Full blood count: microcytic hypochromic anaemia
- Ferritin
- Further investigations: peripheral smear, DNA analysis, X-ray for skeletal deformities.

### PCH

#### Vaccination: DTP

Physical exam: **Pale | Large spleen and liver**

Laboratory test : Hemoglobine | Microcrosis red blood cells

Referral to Thalassaemia clinic

Parents are advised about routine vaccinations

Cascade Screening of Family

**Diagnosis :** Beta Thalassaemia
